Description

The present invention relates to compounds having antiviral activity, processes for their preparation and pharmaceutical compositions containing them.

EP-A-108285 (The Wellcome Foundation Limited) discloses purine derivatives having antiviral activity. The compound 9-(4-hydroxy-3-hydroxymethylbut-1-yl) guanine of formula (A)

is disclosed in Synthetic Communications, 2(6), 345-351 (1972) but no pharmaceutical activity has been indicated for the compound in this document. We have subsequently shown that the compound of formula (A) does have pharmaceutical activity, and this is disclosed in EP-A-141927 (Beecham Group p.l.c.).

We have now prepared a series of analogues of the compound of formula (A) which has useful oral absorption properties and is converted *in vivo* to the compound of formula (A) which has anti-viral activity.

According to the present invention there is provided a compound of formula (I)

or a salt thereof, wherein R_1 and R_2 are each independently hydrogen, acyl or phosphate, provided that when one of R_1 or R_2 is phosphate, the other is hydrogen; or R_1 and R_2 are joined together to form a cyclic acetal group, a cyclic carbonate group or a cyclic phosphate group.

Acyl groups for R_1 and R_2 are those where the group R_1O- or R_2O- is a pharmaceutically acceptable carboxylic ester group which are

where R_3 is C_{1-6} alkyl, C_{1-6} alkoxy, or optionally substituted aryl.

As used herein the term 'aryl' includes phenyl which may be optionally substituted with one or two groups selected from C_{1-6} alkyl, C_{1-6} alkoxy or halo such as fluoro or chloro.

Preferably R_3 is methyl, ethyl, propyl, methoxy, or phenyl.

Suitably when R_1 and R_2 are joined together, they

5 constitute a group

A suitable example of a compound of formula (I) is the compound where one of R_1 or R_2 is

and the other is hydrogen.

15 In the case of compounds of formula (I) wherein one of R_1 or R_2 is an acyl or phosphate group, the compound exists in two enantiomeric forms. The invention includes both enantiomers in isolated form and mixtures thereof.

The compounds of the invention may be in crystalline form or as hydrates and it is intended that both forms are encompassed by the expression 'compound of formula (I)' used herein.

20 Salts of the compound of formula (I) are preferably pharmaceutically acceptable, but non-pharmaceutically acceptable salts are also within the scope of the present invention, since these are useful as intermediates in the preparation of pharmaceutically acceptable compounds.

Examples of pharmaceutically acceptable salts of the compound of formula (I) are acid addition salts formed with a pharmaceutically acceptable acid such as hydrochloric acid, orthophosphoric acid and sulphuric acid.

25 When the compound of formula (I) contains a phosphate group suitable salts include metal salts, such as aluminium, alkali metal salts such as sodium or potassium, alkaline earth metal salts such as calcium or magnesium and ammonium or substituted ammonium salts, for example those with lower alkylamines such as triethylamine, hydroxy-lower alkylamines such as 2-hydroxyethylamine, bis-(2-hydroxyethyl)-amine or tri-(2-hydroxyethyl)-amine.

and subsequently, if necessary, converting the compound of formula (I) thus formed to the free base or to a different salt thereof.

Preferably the hydrolysis of the compound of formula (II) is carried out in acid medium, conveniently aqueous hydrochloric acid.

20

The compound of formula (II) is itself an example of a compound of formula (I) and may be prepared by reducing a compound of formula (III)

45

50

(VIII)

55

wherein R_4 and R_5 are the same or different acyl groups, or R_4 and R_5 are joined together to form a cyclic carbonate group.

Suitable acyl groups for R_4 and R_5 include groups

as hereinbefore defined.

10 The reduction is suitably carried out under conditions described above for the reduction of a compound of formula (III).

Compounds of formula (I) wherein R_1 and R_2 are acyl groups can be converted to a compound of formula (I) wherein R_1 and or R_2 are hydrogen by conventional deacylation or partial deacylation processes. For example, reaction with methanolic ammonia can be used to effect complete deacylation to yield
15 compound of formula (I) wherein both R_1 and R_2 are hydrogen. Reaction with a mild base such as potassium carbonate can result in partial deacylation to produce a compound of formula (I) wherein one of R_1 or R_2 is hydrogen and the other is an acyl group.

Compounds of formula (VIII), may be prepared by treating the compound of formula (V) as hereinbefore defined, with a compound of formula (X)
20

The compound of formula (V) is a known compound.

Compounds of formula (X) in which Z is bromine may be prepared by brominating a compound of formula (XI).
35

Compounds of formula (X) in which Z is Cl or I may be prepared in an analogous manner.

Compounds of formula (XI) in which R_4 and R_5 are the same and are acyl groups may be prepared according to the following schematic process:
50

wherein R⁶ is a removable protecting group.

Suitably R_6 is a group removable by hydrolysis or hydrogenolysis.

Preferably R₆ is a group removable by hydrogenolysis such as benzyl. This group can be removed by conventional methods for example by using hydrogen in the presence of a palladium/carbon catalyst.

Compounds of formula (XI) wherein R₄ and R₅ are joined together to form a cyclic carbonate group may be prepared by reaction of a compound formula (XII)

wherein R₆ is a hereinbefore defined with phosgene or 1,1' - carbonyldiimidazole, and thereafter if desired removing the protecting group R₆. The reaction is suitably carried out in a dry organic solvent such as pyridine at a temperature of from 0° - 50° c, conveniently at ambient temperature.

The above described processes for preparing the compound of formula (III) and compounds of formula (VIII) are also disclosed in Published European Patent Application No. 0141 927.

Compounds of formula (I) wherein R₁ and/or R₂ is acyl may be prepared by esterifying a compound of formula (I) wherein R₁ and R₂ is hydrogen by conventional methods. If necessary during the esterification process the -NH₂ group and optionally also one of the -OR₁ or -OR₂ groups may be protected by a suitable protecting group such as trityl or monomethoxytrityl. The product is subsequently deprotected for example by treatment with acid such as acetic acid. For example, compounds of formula (I) wherein R₁O- and/or R₂O- is a carboxylic ester group may be prepared by reaction of a compound of formula (I) which has been optionally protected as described above with (a), an appropriate carboxylic acid chloride or (b) an appropriate carboxylic acid anhydride or (c) an appropriate carboxylic acid in the presence of a dehydrating agent such as dicyclohexylcarbodiimide (DCCl).

Compounds of formula (I) wherein R₁ and R₂ form a cyclic carbonate group can be prepared by reaction of a compound of formula (I) wherein R₁ and R₂ are hydrogen and the NH₂ group is optionally protected; with phosgene or 1,1-carbonyldiimidazole, and thereafter if necessary deprotecting the product. Suitable protecting groups for the NH₂ group include trityl and monomethoxytrityl as described above. The reaction is suitably carried out in a dry organic solvent such as pyridine at a temperature of from 0°-50° C, conveniently at ambient temperature.

Compounds of formula (I) wherein one of R₁ or R₂ is phosphate or R₁ and R₂ together form a cyclic phosphate can be prepared by treating a compound formula (XIII)

wherein R₇ is a protecting group and R₈ and R₉ are hydrogen or a protecting group provided that one of R₈ or R₉ is hydrogen; with a phosphorylating agent and thereafter if desired deprotecting resultant product. When R₈ and R₉ are both hydrogen, a cyclic phosphate compound is produced. Suitable protecting groups for R₇ and R₈ or R₉ are trityl or monomethoxytrityl. Deprotection of the resultant product can then be effected by treatment with acid such as acetic acid.

A suitable phosphorylating agent is phosphorus oxychloride, optionally in the presence of a base such as pyridine.

In addition, when one of R₈ or R₉ is a protecting group cyanoethyl phosphoric acid can be employed as a phosphorylating agent in order to produce a compound of formula (I) wherein one of R₁ or R₂ is phosphate.

The reaction product after treatment with cyanoethyl phosphoric acid is treated with aqueous ammonia, which yields the ammonium salt of the phosphate ester as the final product.

Compounds of formula (XIII) can be prepared by protection of a compound of formula (I) wherein R₁ and R₂ is hydrogen, for example by reaction with a trityl or monomethoxytrityl halide such as monomethoxytrityl chloride.

Alternatively compounds of formula (I) wherein R₁ and R₂ are joined together to form a cyclic phosphate can be prepared from a compound of formula (I) wherein one of R₁ or R₂ is phosphate and the other is hydrogen by cyclisation of the monophosphate for example using dicyclohexylcarbodiimide.

Compounds of formula (I) wherein one of R₁ or R₂ is acyl and the other is hydrogen or R₁ and R₂ together form a cyclic acetal can be prepared by reacting a compound of formula (I) wherein R₁ and R₂ are hydrogen with a compound of formula (XIV)

wherein

R₁₀ is C₁₋₆ alkyl,

R₁₁ is C₁₋₆ alkyl,

m is 0, 1 or 2, and

n is an integer of 2, 3 or 4

provided that m + n is equal to 4,

and thereafter, if n is 3 or 4, hydrolysing the product.

When a compound of formula (I) in which R₁ and R₂ is a cyclic acetal is required, a compound of formula (XIV) wherein m is 2 and n is 2 is employed. For example, when m is 2, n is 2 and R₁₀ is methyl, the product is the compound of formula (II) as hereinbefore defined. The reaction is suitably carried out in an inert organic solvent such as tetrahydrofuran or N,N-dimethylformamide, in the presence of an acid such as p-toluene sulphonic acid.

Where necessary the subsequent hydrolysis step is an aqueous hydrolysis preferably carried out in the presence of an acid such as p-toluene sulphonic acid.

Compounds of formula (XIV) are known compounds or can be prepared from known compounds by known methods.

Compounds of formula (I) or pharmaceutically acceptable salts thereof may be formulated for use in a pharmaceutical composition. Accordingly, in a further aspect of the invention, there is provided a pharmaceutical composition which comprises a compound of formula (I) or pharmaceutically acceptable salt thereof together with a pharmaceutically acceptable carrier or excipient.

5 A composition which may be administered by the oral route to humans may be compounded in the form of a syrup, tablet or capsule. When the composition is in the form of a tablet, any pharmaceutical carrier suitable for formulating such solid compositions may be used, for example magnesium stearate, starch, lactose, glucose, rice, flour and chalk. The composition may also be in the form of an ingestible capsule, for example of gelatin, to contain the compound, or in the form of a syrup, a solution or a
10 suspension. Suitable liquid pharmaceutical carriers include ethyl alcohol, glycerine, saline and water to which flavouring or colouring agents may be added to form syrups. The compounds may also be presented with a sterile liquid carrier for injection.

The composition may also be formulated for topical application to the skin or eyes.

For topical application to the skin, the composition may be in the form of a cream, lotion or ointment.
15 These formulations may be conventional formulations well known in the art, for example, as described in standard books of pharmaceutics and cosmetics, such as Harry's Cosmetology published by Leonard Hill Books and the British Pharmacopoeia.

The composition for application to the eyes may be a conventional eye-drop composition well known in the art, or an ointment composition.

20 Preferably, the composition of this invention is in unit dosage form or in some other form that the patient may administer to himself a single dose. A suitable dosage unit might contain from 50 mg to 1 g of active ingredient, for example 100 to 500 mg.

Such doses may be administered 1 to 4 times a day or more usually 2 or 3 times a day. The effective dose of compound will in general be in the range of from 1.0 to 20 mg/kg of body weight per day or more
25 usually 2.0 to 10 mg/kg per day.

No toxicological effects are indicated at the above described dosage levels.

In a further aspect of the invention there is provided the use of a compound of formula (I) or a pharmaceutically acceptable salt thereof, in the manufacture of a medicament for use in the treatment of viral infections.

To an aqueous solution of 2-amino-9-(4-hydroxy-3-hydroxymethylbut-1-yl)purine (0.5mM , 0.7ml; pH7) was added bovine milk xanthine oxidase (20μl, 0.4 unit). Dissolved atmosphere oxygen was allowed to act as electron acceptor and changes in the UV spectrum were measured. After 4 minutes 25% conversion had occurred and after 2.5 hours conversion was essentially complete. The oxidation product was identified as

10

9-(4-hydroxy-3-hydroxymethylbut-1-yl)guanine by its UV spectrum and HPLC retention time.
(Incubation of 9-(4-hydroxy-3-hydroxymethylbut-1-yl)guanine with xanthine oxidase under identical conditions resulted in no change over a 2 hour period.)

15 Oral Absorption of 2-Amino-9-(4-hydroxy-3-hydroxymethylbut-1-yl) purine and 2-Amino-9-(4-acetoxy-3-acetoxymethylbut-1-yl)purine and their Conversion to 9-(4-hydroxy-3-hydroxymethylbut-1-yl) guanine in Mice

20 Procedure

2-Amino-9-(4-hydroxy-3-hydroxymethylbut-1-yl)purine, 2-amino-9-(4-acetoxy-3-acetoxymethylbut-1-yl)-purine and 9-(4-hydroxy-3-hydroxymethylbut-1-yl)guanine were administered by oral gavage (0.2mmoles/kg in 0.1ml of 1% carboxymethyl cellulose) to 20g female Balb/C mice which had been starved for 18 hours. Fifteen 60 and 180 minutes later, blood was collected from three mice per time point by cardiac puncture using heparinised syringes. Equal aliquots at each time were pooled and an equal volume of 16% trichloroacetic acid added. Following centrifugation (8,500g) to remove precipitated proteins, 0.5ml of supernatant was immediately added to 0.1ml of saturated sodium bicarbonate solution and the resulting mixture analysed by high performance liquid chromatography or stored at -20° C prior to analysis.
